Amendment After Final Rejection Attorney Docket No.: 062404

Application No.: 10/582,884

Art Unit: 1791

## **AMENDMENTS TO THE CLAIMS**

## Listing of claims:

This listing of claims replaces all prior versions and listings of claims in the application.

1. (Current Amended) A method for producing a flexible laminate comprising a heat-resistant adhesive film (A) and a metal foil (B) bonded to at least one surface of the heat-resistant adhesive film (A), the method comprising:

a step of performing thermal lamination by passing the heat-resistant adhesive film (A) and the metal foil (B) between at least one pair of metal rollers through a protective film with applying linear pressure;

a step of slowly cooling a laminate comprising the heat-resistant adhesive film (A), the metal foil (B), and the protective film without applying linear pressure, wherein the cooling step is performed by a slow-cooling roller only, or by a slow-cooling roller in combination with at least one of a far infrared heater, a near infrared heater or a heating oven; and a step of separating the protective film.

- 2. (Original) The method for producing the flexible laminate according to Claim 1, wherein the slow cooling step is performed by providing a heating mechanism of which temperature is set lower than the surface temperature of the metal rollers.
- 3. (Original) The method for producing the flexible laminate according to Claim 2, wherein the heating mechanism comprises a slow-cooling roller.

Application No.: 10/582,884

Art Unit: 1791

Amendment After Final Rejection
Attorney Docket No.: 062404

4. (Original) The method for producing the flexible laminate according to Claim 3, wherein the surface temperature of the slow-cooling roller is set lower than the surface temperature of the metal rollers by 50°C to 250°C.

- 5. (Original) The method for producing the flexible laminate according to Claim 3, wherein the surface temperature of the slow-cooling roller is set in a range of 150°C to 350°C.
- 6. (Original) The method for producing the flexible laminate according to Claim 1, wherein, in the slow cooling step, the cooling rate for the laminate is set in a range of 50°C/min to 300°C/min.
- 7. (Currently Amended) A method for producing a flexible laminate comprising a heat-resistant adhesive film (A) comprising one layer or two or more layers, one surface or both surfaces of the heat-resistant adhesive film (A) comprising a thermally fusible resin, and a metal foil (B) bonded to at least one surface of the heat-resistant adhesive film (A), the method comprising:

a step of performing thermal lamination by passing the heat-resistant adhesive film (A) and the metal foil (B) between at least one pair of metal rollers through a protective film with applying linear pressure;

Attorney Docket No.: 062404

a step of slowly cooling a laminate comprising the heat-resistant adhesive film (A), the metal foil (B), and the protective film at a cooling rate of 300°C/min or less without applying linear pressure until the surface temperature of the laminate is decreased to a temperature equal to or less than the glass transition temperature of the thermally fusible resin, wherein the cooling step is performed by a slow-cooling roller only, or by a slow-cooling roller in combination with at least one of a far infrared heater, a near infrared heater or a heating oven; and

a step of separating the protective film.

8. (Original) The method for producing the flexible laminate according to Claim 7, wherein a slow-cooling roller of which temperature is set at the glass transition temperature of the thermally fusible resin is provided.

9. (Original) The method for producing the flexible laminate according to any one of Claims 1 to 8, wherein the slow cooling step is performed by providing a plurality of heating mechanisms including a slow-cooling roller.

10. (Canceled)
